Subject: Simonstone Site MM5

I would point out that Whins Lane along the edge of the proposed site is already a significant traffic hazard. As regular walker and cyclist along that lane, I would point out that the actual width of the road is already very dangerous as cars cannot pass each other when walkers/ cyclists are along the road to the west of the designated area. So it generates the question where on earth can access to the site can be positioned without making the risk of accidents significantly higher.
